

## How can my furniture be so soiled????

- All furniture accumulates contamination.
- Before it becomes this visible, some of the contamination settles into the fibers where you don't see it.
- During use, the contamination gets sucked into the filling and some get's expelled back into the air.

Sally wouldn't be smiling if she could see what she was breathing.

When we compress the foam we push the contamination in. And when we get up, as the foam expands it sucks the contamination deeper.

As the furniture becomes saturated with contamination it expels excessive amounts as you sit down and use it

- Typical "Appearance Cleaners" don't pre-vacuum prior to cleaning!
- And if you don't remove this contamination while it is dry it is almost impossible to remove once it gets wet from cleaning.
- Most homeowners, housekeepers and especially janitors hardly ever vacuum
- And when they do, they usually don't it properly.
- Vacuuming must be slow and methodical to be effective!

### Upholstery fabric before cleaning.

- Pet & human hair,
- wine, and other liquid contamination
- Invisible bio-contamination on the surface and in the foam and fill.

Fabric Layer

Fiber Fill or  
Feather Layer

Foam Layer

### Typical "Appearance" Cleaners

- Surface is cleaner, some soil and spots are left behind
- Foam and fill are still contaminated
- It must be thoroughly pre-vacuumed before it gets wet!

### Chet's Silver Cleaning

- We always thoroughly pre-vacuum before cleaning.
- If the fabric was neglected like above you should get Platinum Cleaning.
- Some spots will re-appear

### Chet's Gold Cleaning

- If the fabric was neglected like above you should get Platinum Cleaning.
- There is still some soil and contamination left that can re-surface

### Chet's Platinum Cleaning

- Absolutely the most healthy and thorough cleaning available anywhere!
- Surface soil and stains removed \*\*
- The most contamination removed!
